

Commercial Infrared Surveys

For Preventive Maintenance

"Our Pictures are Worth a Thousand Words!"

Infrared thermography is the most effective proven non-destructive preventive maintenance technology available to quickly, accurately and safely locate problems prior to failure.

In June 2001, *Maintenance Technology* magazine reported a \$4 return on investment for every \$1 spent on infrared inspection. Finding and fixing a weak component before it fails can save you the much greater costs associated with manufacturing downtime, production losses, power outages, fires and catastrophic failures.

Many Common Benefits of an Industrial Infrared Survey

- ✧ Reduce downtime and emergency repairs
 - ✧ Evaluate and verify repair work
- ✧ Reduce man-hours spent on preventive maintenance by pinpointing areas that need repair
- ✧ Locate potential problems and check electrical systems prior to plant start-up
- ✧ Extend equipment life. Increase reliability of plant power distribution system.
 - ✧ Prevents accidents, personal injury and property damage.
 - ✧ Prevent risk of fire due to electrical failure.
 - ✧ Reduce casualty loss of equipment
- ✧ Minimize scheduled maintenance times by allowing for spare parts to be on-hand prior to shutdown.
- ✧ Promotes a more efficient preventative maintenance program
